# Parameters of Interest

Philipp Eisenhauer

## Heckman (2008) sets out three tasks for us:

- Defining the Set of Hypotheticals or Counterfactuals ⇒ A Scientific Theory
- Identifying Causal Parameters from Real Data ⇒ Mathematical Analysis of Data Point or Set Identification
- Identifying Parameters from Real Data ⇒ Estimation and Testing Theory

# Setup

# The Generalized Roy Model

#### **Potential Outcomes**

$$Y_1 = \mu_1(X) + U_1$$

$$Y = DY_1 + (1 - D)Y_0$$

$$Y_0 = \mu_0(X) + U_0$$

#### Choice

$$D = I[\mu_D(X, Z) - V > 0]$$

#### **Useful Notation**

$$P(X, Z) = Pr(D = 1 | X, Z) = F_V(\mu_D(X, Z))$$
  
 $U_D = F_V(V)$ 

**Specification** We follow the parameterization in Heckman and Vytlacil (2005):

$$Y_1 = \gamma + \alpha + U_1$$
  $U_1 = \sigma_1 \epsilon$   $\gamma = 0.670$   $\sigma_1 = 0.012$   $Y_0 = \gamma + U_0$   $U_0 = \sigma_0 \epsilon$   $\alpha = 0.200$   $\sigma_0 = -0.050$   $D = I[Z - V > 0]$   $V = \sigma_V \epsilon$   $\epsilon \sim \mathbb{N}(0, 1)$   $\sigma_V = -1.000$ 

$$Z \sim \mathbb{N}(-0.0026, 0.2700)$$
  $U_D = \Phi\left(\frac{V}{\sigma_V \sigma_c}\right)$ 

# Individual Heterogeneity

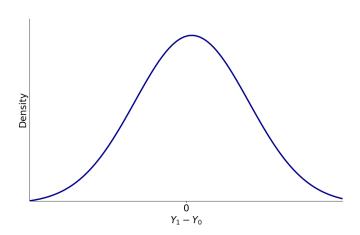

## Individual-specific Benefit of Treatment

$$Y_1 - Y_0 = (\mu_1(X) - \mu_0(X)) + (U_1 - U_0)$$

# Sources of Heterogeneity

- Difference in Observable Characteristics
- Difference in Unobservable Characteristics
  - Uncertainty
  - Private Information

Figure: Distribution of Benefits

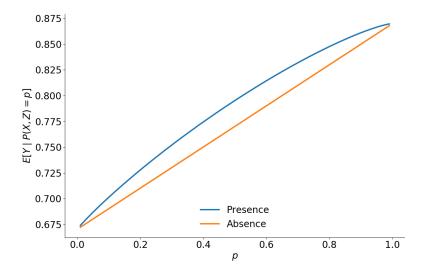

# Essential Heterogeneity Definition: Individuals se-

lect their treatment status based on gains unobservable by the econometrician. More formally,

$$Y_1 - Y_0 \not\perp \!\!\!\perp D \mid X = x.$$

⇒ consequences for the choice of the estimation strategy

Figure: Conditional Expectation and Essential Heterogeneity

# Conventional Average Treatment Effects

# **Conventional Average Treatment Effects**

$$B^{ATE} = E[Y_1 - Y_0]$$
  
 $B^{TT} = E[Y_1 - Y_0 \mid D = 1]$   
 $B^{TUT} = E[Y_1 - Y_0 \mid D = 0]$ 

⇒ correspond to *extreme* policy alternatives

#### **Selection Problem**

$$\begin{split} E[Y \mid D = 1] - E[Y \mid D = 0] &= \underbrace{E[Y_1 - Y_0]}_{B^{ATE}} \\ &+ \underbrace{E[Y_1 - Y_0 \mid D = 1] - E[Y_1 - Y_0]}_{\text{Sorting Gain}} \\ &+ \underbrace{E[Y_0 \mid D = 1] - E[Y_0 \mid D = 0]}_{\text{Selection Bias}} \end{split}$$

$$E[Y \mid D = 1] - E[Y \mid D = 0] = \underbrace{E[Y_1 - Y_0 \mid D = 1]}_{B^{TT}} + \underbrace{E[Y_0 \mid D = 1] - E[Y_0 \mid D = 0]}_{\text{Selection Bias}}$$

⇒ the bias depends on the parameter of interest

Figure: Distribution of Effects with Essential Heterogeneity

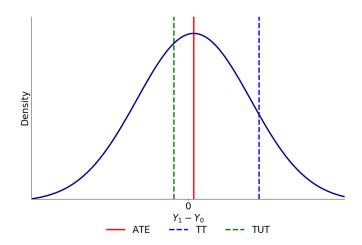

Figure: Distribution of Effects without Essential Heterogeneity

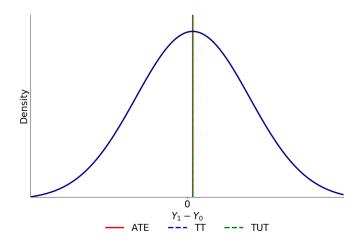

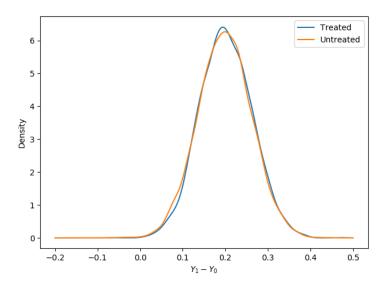

Figure: Distribution of Benefits by Treatment Status

# Policy-Relevant Average Treatment Effects

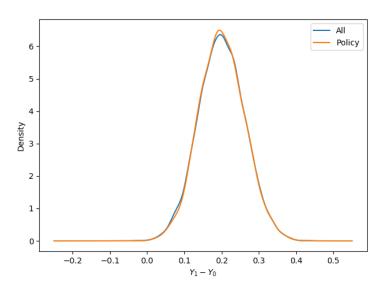

#### **Observed Outcomes**

$$Y_B = D_B Y_1 + (1 - D_B) Y_0$$
  
 $Y_A = D_A Y_1 + (1 - D_A) Y_0$ 

## **Effect of Policy**

$$B^{PRTE} = \frac{1}{E[D_A] - E[D_B]} (E[Y_A] - E[Y_B])$$

## Figure: Distribution of Benefits for Policy

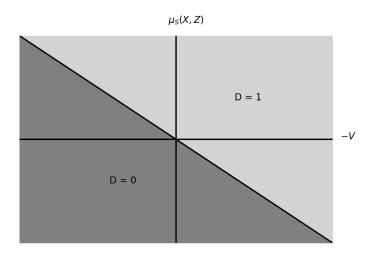

# Marginal Effect of Treatment

## **Marginal Benefit of Treatment**

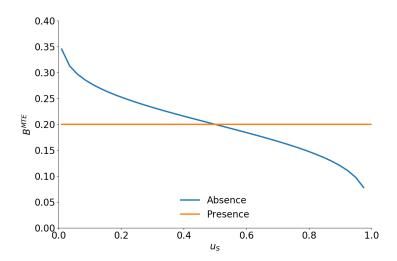

$$B^{MTE}(x, u_D) = E[Y_1 - Y_0 \mid X = x, U_D = u_D]$$

**Intuition:** Mean gross return to treatment for persons at quantile  $u_D$  of the first-stage unobservable V or a willingness to pay for individuals at the margin of indifference.

# Figure: Margin of Indifference

# Figure: Marginal Benefit of Treatment

Effects of Treatment as Weighted Averages Parameter  $\Delta_j$ , can be written as a weighted average of the  $B^{MTE}(x, u_D)$ .

$$\Delta_j(x) = \int_0^1 B^{MTE}(x, u_D) \omega^j(x, u_D) du_D,$$

where the weights  $\omega^{j}(x,u_{D})$  are specific to parameter j and integrate to one.

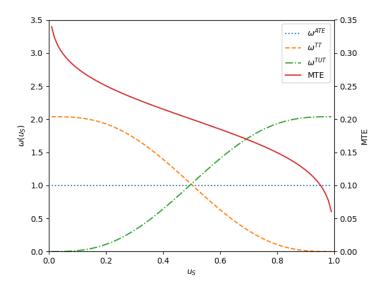

## Weights

$$\omega^{ATE}(x, u_D) = 1$$

$$\omega^{TT}(x, u_D) = \frac{1 - F_{P|X=X}(u_D)}{E[P \mid X = X]}$$

$$\omega^{TUT}(x, u_D) = \frac{F_{P|X=X}(u_D)}{E[1 - P \mid X = X]}$$

Figure: Effects of Treatment as Weighted Averages

# Local Average Treatment Effect

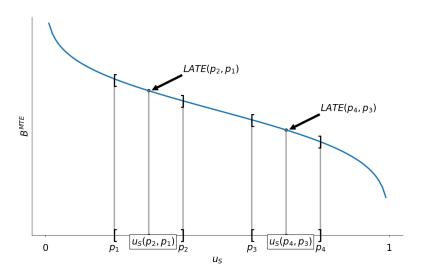

## **Local Average Treatment Effect**

- ► Local Average Treatment Effect: Average effect for those induced to change treatment because of a change in the instrument.⇒ instrument-dependent parameter
- Marginal Treatment Effect: Average effect for those individuals with a given unobserved desire to receive treatment.
  - ⇒ deep economic parameter

$$B^{LATE} = \frac{E(Y \mid Z = z) - E[Y \mid Z = z']}{P(z) - P(z')}$$

$$B^{LATE}(x, u_D, u_{S'}) = \frac{1}{u_D - u_{D'}} \int_{u_D}^{u_{S'}} B^{MTE}(x, u) du,$$
